

THE LATEST ADVANCE ON THE TRANSISTOR.

THE LATEST ADVANCE ON THE VALVE.

The age of the valve has departed, like the steam engine, preserved only by a handful of nostalgic enthusiasts.

If you believe that, it's a bit like saying that analogue has been killed off by digital, and we all know what a hot potato that argument has become.

For valves still have several inherent advantages, even before you consider the soulless way some solid-state circuitry is put together these days.

Valve technology is moving ahead faster than ever before. Which means new circuitry, endless research and painstaking development to maximise the potential which this beautiful little device is demonstrably capable of giving.

The beauty is the warmth you feel when, instead of just sitting in front of the music, it envelopes and uncannily involves you.

The P35 MkII is the very latest example of how a valve amplifier can evoke these emotions. It is one of our range of control and power amplifiers which come both in stereo and monoblock configurations.

If you are looking for truly high quality amplification equipment, all we ask is that you include Beard on your shortlist.

And when you audition them, the only thing you'll find it has in common with the others is that it runs on electricity.

Not, as some people may have thought, on steam.
